Title: Risks to a mountain summit ecosystem with endemic biota in southwestern Australia

Abstract: ... "We found the ecosystem to be Critically Endangered based on its naturally limited geographic extent and area of occupancy in combination with the impacts of the plant pathogen *Phytophthora cinnamomi*. ... to decline further in the absence of intensive management due to current threatening processes as well as the potential future impacts of climate change ..."

Output:

Input is reporting ecosystem change in a negative direction. There is primary evidence available for link between the change and their anthropogenic drivers

Output labels:

Q1, Q2, Q3, Q4: All equals "Yes" (=1)
Q1 biodiversity change type(s): ["ecosystem change"]
Q2 direction = ["negative"]
Q3 driver(s): ["Invasive alien species", "Climate change"]
Q4 linkage type = ["direct primary evidence"]
